

Task 1 - Debug Login Route

Purpose of AI Use: Debugging and problem solving

Chat Link or Prompt/Response: <https://chatgpt.com/c/6ab98a79-d47c-83e9-ac48-455ef6f1c3ba>

AI-Suggested Content: When POST `/api/auth/login` initially returned 'Cannot POST `/api/auth/login`', ChatGPT helped me check the route and determine that an older Node process was still listening on port 3000. It guided me through identifying the process, stopping it, and starting the application again.

Validation: I used `lsof` to identify the Node process on port 3000, stopped it, restarted `npm start`, and sent the login request again. The endpoint then returned a successful JSON response.

Decision: Accepted after testing it

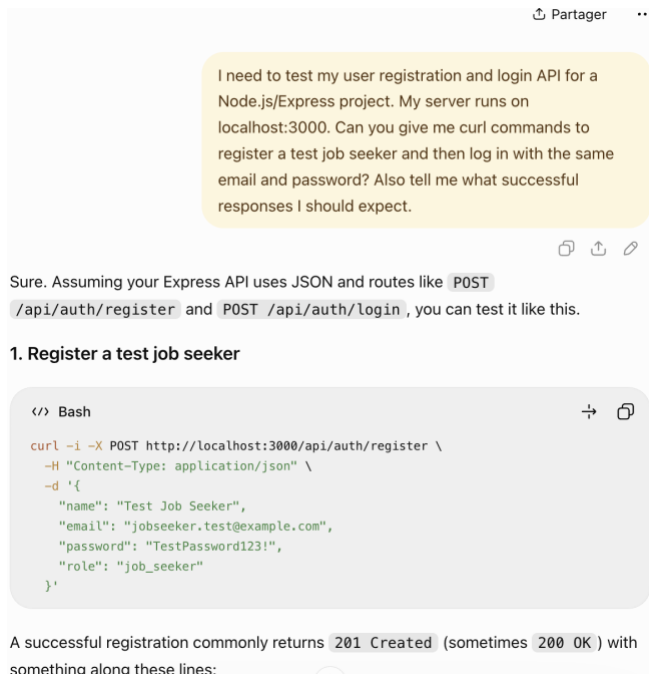

Reflection: I learned that saving a route change does not necessarily mean the currently running Node process has loaded it. Restarting the correct server process fixed the problem.

Responsible Person: Me Joelle Al Haddad

Task 2 - Registration and Login API Testing

Purpose of AI Use: Test preparation, debugging, and validation.

Chat Link: <https://chatgpt.com/c/6ab98b13-299c-83ea-b513-9c544d7f0f9d>

AI-Suggested Content: ChatGPT helped me prepare curl requests to register a test job seeker and then log in using the same email and password.

Validation: The registration request returned 'User registered successfully' with a user ID. The login request then returned 'Login successful' and the expected user information, including the job_seeker role.

Decision: I accepted

Reflection: Testing both registration and login together confirmed that the stored password hash could be checked correctly during login and that the new endpoint worked with real data in the local database

Responsible Person: Me Joelle Al Haddad

Task 3 – The 10 ai generated user stories

Purpose of AI: to generate 10 user stories that we can use for our project

I don't have the Claude AI link or picture because I didn't ask the AI for them

Decision: Accepted, we used them

Responsible Person: Harsh Patel
